As primary health care providers, denturists have the ultimate responsibility to determine the efficacy of any osseous implant therapy for their patients. Do you know:

- how to properly assess the supporting tissues?
- how to determine the type and number of abutments?
- how to select the correct abutments?
- where to properly place the abutments?
- what teeth to use in constructing the denture?
- how to properly assess patient requirements?
- how to properly evaluate the case?
-how to assure a successful result?

If you do not know these answers, here is an opportunity to learn and to enhance the quality of your practice.
